## Description

### Taste Masked Formulations

#### Technical Field

- 5           The present invention relates to taste-masked pharmaceutical formulations.

#### Background Art

- 10           The production of a palatable dosage form is very important for patient compliance. The masking of unpleasant tastes is therefore an important consideration in the formulation of many therapeutic agents and is achieved by minimizing direct contact between the active species and the taste receptors in the buccal cavity of the subject .

- 15           Cationic copolymers synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters such as Eudragit E 100 have been employed in various taste-masking formulations. For instance, U.S. Pat. No. 5,275,823 discloses a chewable tablet comprising a granulate of a histamine H<sub>2</sub>-receptor antagonist and optionally Eudragit E 100 and an admixture of a taste-masking extragranular water-insoluble hygroscopic excipient. While the purpose of the extragranular water-insoluble  
20           hygroscopic excipient is to reduce or eliminate the intensely bitter taste, Eudragit E 100 can be included in the granulate to provide extra taste-masking properties. Examples show a ratio of Eudragit E 100 to drug of 1 to 10.

- 25           U.S. Pat. No. 5,489,436 discloses a chewable medicament tablet comprising a medicament coated with a taste-masking amount of a polymer blend of dimethylaminoethyl methacrylate and neutral methacrylic acid esters and a polymer selected from cellulose acetate and cellulose triacetate. This coating blend is intended to achieve a balance between taste masking, dissolution and rate of bioavailability.

U.S. Pat. No. 4,708,867 discloses a mini pellet dosage form of prednisone comprising a nonpareil seed coated with a first layer of the drug and a second layer of a copolymer of dimethylaminoethyl methacrylate and methyl methacrylate.

5 U.S. Pat No. 5,013,557 discloses a spray-dried spheroidal microcapsule comprising 1-70 wt% sucralfate and 30-99 wt % of a polymer soluble in gastric fluids such as maltrin. The examples illustrate 1:1 sucralfate to maltrin microcapsules, which can be incorporated in chewable products.

10 U.S. Pat. No. 4,760,093 discloses a taste neutral powder form of spray-dried acetaminophen which consists essentially of about 60% to 74% by weight acetaminophen and about 26% to 40% by weight of a copolymer, cationic in character, based on dimethylaminoethyl methacrylate and neutral methacrylic acid esters.

15 However, none of the patents listed above teach the advantageous use of employing cationic copolymers synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters in amounts significantly greater than the amount of drug in need of taste masking to form with the drug a taste-masked micromatrix powder.

20 Disclosure of Invention

The invention provides a taste-masked pharmaceutical powder comprising micromatrices containing a drug having poor organeleptic properties and a cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters, wherein the wt/wt ratio of  
25 the copolymer to the drug is greater than 2 to 1.

These micromatrix powders can be incorporated into and used in several different final dosage forms, more particularly oral dosage forms such as sprinkles, suspensions, chewable tablets, fast melt tablets and effervescent tablets without the unpleasant possibility of a taste-masking  
30 coating being breached by mastication or insufficient amounts of taste masker being present to provide adequate elimination of the unpleasant organoleptic properties of the drug.

Preferably, the micromatrices are manufactured using a spray drying procedure in which the powder is formed by spray drying a solution or dispersion containing the drug having poor organoleptic properties and the copolymer.

- 5 In this manner, the drug is completely taste masked, including those drugs having foul organoleptic properties, in particles sized to avoid exceeding the "mouth-feel" threshold.

- Further, the taste-masked micromatrix powder of this invention is capable of not only masking drugs with undesirable taste characteristics but  
10 also controlling the rate at which the drug is delivered following oral administration to a subject such as a human.

Thus, the micromatrices can further comprise a retarding polymer.

More particularly, the retarding polymer and the drug having poor organoleptic properties can comprise a controlled release powder.

- 15 In one embodiment the taste-masked powder is formed by granulating the controlled release powder with the cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters.

- In a further embodiment the invention provides a taste-masked  
20 pharmaceutical powder comprising micromatrices containing a controlled release powder and a cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters, wherein the controlled release powder comprises a drug having poor organoleptic properties and a retarding polymer and wherein the wt/wt ratio  
25 of the cationic copolymer to the drug is greater than 2 to 1.

- Thus, the present invention provides taste-masked micromatrix powders in which the ratio of the cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters compared to a drug having poor organoleptic properties is greater than 2 to  
30 1, preferably 4 to 1, most preferably 6 to 1 when compared weight to weight. The drug and the copolymer such as Eudragit E 100 comprise

micromatrices having an average size from about 1  $\mu\text{m}$  to 125  $\mu\text{m}$ , preferably average particle sizes from about 5  $\mu\text{m}$  to 30  $\mu\text{m}$ .

Drugs whose target dissolution profile calls for immediate release can be efficiently taste masked and delivered from micromatrix powders which contain primarily Eudragit E, which is soluble in gastric fluids, and the drug having poor organoleptic properties. Alternatively, drugs whose target dissolution profile requires controlled and/or sustained release over a period of time such as 30 minutes to 24 hours can be incorporated first into controlled release powders which comprise micromatrices of the drug and a retarding polymer such as by spraying drying the drug with the retarding polymer. Micromatrix taste-masked powders can then be made, for instance, by granulating the controlled release powders with the cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters such that the amount of cationic copolymer is greater than twice the amount of drug based upon weight.

The drugs having poor organoleptic properties are preferably  $\text{H}_2$  receptor antagonists, antibiotics, analgesics, cardiovascular agents, ~~peptides or proteins, hormones,~~ anti-migraine agents, anti-coagulant agents, anti-emetic agents, anti-hypertensive agents, narcotic antagonists, chelating agents, anti-anginal agents, chemotherapy agents, sedatives, anti-neoplastics, prostaglandins and antidiuretic agents, more preferably nizatidine or roxatidine.

The immediate release or sustained release taste-masked powders of this invention can be incorporated into conventional oral dosage forms such as sprinkles, suspension, chewable tablets, fast melt tablets or effervescent tablets.

As used in this specification and appended claims, the singular forms "a", "an" and "the" include plural referents unless the content clearly dictates otherwise. Thus, for example, reference to a "a drug" includes reference to one or more drugs, and the like.

As used herein, the term "drug having poor organoleptic properties" refers to a drug or therapeutic agent possessing taste and/or odor characteristics which, when administered orally without any excipients,

render the drug or therapeutic agent unpalatable to a subject. There is essentially no limitation on the type of drug having poor organoleptic properties which can be used in this invention other than to exclude those drugs which would be inappropriate to deliver to the subject orally.

- 5 Representative drugs include, but are not limited to, H<sub>2</sub> receptor antagonists, antibiotics, analgesics, cardiovascular agents, peptides or proteins, hormones, anti-migraine agents, anti-coagulant agents, anti-emetic agents, anti-hypertensive agents, narcotic antagonists, chelating agents, anti-anginal agents, chemotherapy agents, sedatives, anti-neoplastics,
- 10 prostaglandins, antidiuretic agents and the like. Typical drugs include but are not limited to nizatidine, cimetidine, ranitidine, famotidine, roxatidine, etinidine, lupitidine, nifentidine, niperitone, sulfotidine, tuvatidine, zaltidine, erythromycin, penicillin, ampicillin, roxithromycin, clarithromycin, psyllium, ciprofloxacin, theophylline, nifedipine, prednisone, prednisolone,
- 15 ketoprofen, acetaminophen, ibuprofen, dexibuprofen lysinate, flurbiprofen, naproxen, codeine, morphine, sodium diclofenac, acetylsalicylic acid, caffeine, pseudoephedrine, phenylpropanolamine, diphenhydramine, chlorpheniramine, dextromethorphan, berberine, loperamide, mefenamic acid, flufenamic acid, astemizole, terfenadine, cetirizine, phenytoin,
- 20 guaifenesin, N-acetylprocainamide HCl, pharmaceutically acceptable salts thereof and derivatives thereof.

- Eudragit E 100 which is a particularly preferred type of Eudragit E for use in accordance with the invention, is available from Rohm Pharma GmbH, Darmstadt, Germany, is a cationic polymer based on
- 25 dimethylaminoethyl methacrylate and neutral methacrylates. It becomes water soluble via salt formation with acids, thus providing gastrosoluble film coatings. Eudragit E films swell and are permeable in water and buffer solutions above pH 5. It is soluble in gastric fluid below a pH of 5. The average molecular weight of Eudragit E is about 150,000 and it neither
- 30 contains any plasticizers nor requires their addition for processing.

Spray dryers can be of the usual laboratory or commercial type. Suitable spray dryers are manufactured by Buchi Laboratoriums-Technik AG and by Niro Atomizer Inc. of Columbia, Md. A bench-scale Buchi spray dryer, Model B-191, was employed in the examples given herein.

### Modes for Carrying Out the Invention

The following examples illustrate the formation of the taste-masked pharmaceutical powders of this invention.

#### *Example 1*

5        *Spray drying procedures.* Spray-dried powders are formulated by preparing a solution or dispersion of a drug having poor organoleptic properties and a cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters (e.g., Eudragit E 100), wherein the ratio (wt/wt) of copolymer to drug is greater than 2:1, and spray  
10        drying the solution/dispersion. For example, spray-dried-Nizatidine powders are suitably prepared by dissolving 150 g of Eudragit E-100 in 800 ml acetone and then adding 200 ml distilled H<sub>2</sub>O and 25 g of Nizatidine, preferably NED free Nizatidine, to the solution (solvent system = acetone:H<sub>2</sub>O (80:20)). If desired, a flavorant or sweetener can be added to  
15        the solution such as 2.5 g aspartame or a sugar. Alternatively, the solvent system suitably can be ethanol:dH<sub>2</sub>O (80:20), 100% ethanol or 100% acetone and the like. The solution is spray dried such as using a Buchi B-191 spray dryer under the following initial conditions: Inlet temperature - 85°C; Outlet temperature - 50°C; Compressed air - 800l/hr; Pump flow -  
20        75% and Aspirator - 100%. Powders formed under these conditions are in the form of a micromatrix and typically, are sized between 1µm and 125µm such as having average particle size of 5 to 30µm (as measured by a Malvern Mastersizer MSS). If desired, the powders can be sieved. Characterization of these powders by scanning electron microscopy shows  
25        that they consist of discrete particles that are irregularly shaped. Typical recovery of product is 70-80% using this modest bench scale but can be greater at pilot and manufacturing scales.

Similarly, a taste-masked powder containing roxatidine in a micromatrix of Eudragit E can be prepared by dissolving Eudragit E in  
30        ethanol and adding roxatidine to this solution followed by spray drying. For instance, a suitably taste-masked powder was formed from Eudragit E/roxatidine in a 4:1 ratio (wt/wt). The theoretical loading for this batch was 20.0%; the actual loading was 19.95% and the size was D[v, 0.5] µm = 31.77.

### Example 2

Optimization of drug:polymer ratio. Batches of spray-dried powders containing Nizatidine and Eudragit E 100 in varying ratios were prepared using the procedures of Example 1. The palatability of these powders were tested and the results are presented in Table 1

Table 1				
Batch	Formulation	Solvent	Drug to Polymer ratio	Organoleptic Evaluation
A	Nizatidine 7.5g Eudragit E 100 7.5g	Ethanol:H <sub>2</sub> O (80:20) 250ml	1:1	very poor
B	Nizatidine 5g Eudragit E 100 10g	Ethanol:H <sub>2</sub> O 350 ml : 5 ml	1:2	poor
C	Nizatidine 1.5g Eudragit E 100 6.0g	Ethanol:H <sub>2</sub> O (80:20) 100ml	1:4	fair
D	Nizatidine 0.5g Eudragit E 100 3.0g	Ethanol:H <sub>2</sub> O (80:20) 100ml	1:6	very good
E	Nizatidine 0.75g Eudragit E 100 6.0g	Ethanol:H <sub>2</sub> O (80:20) 100ml	1:8	very good
F	Nizatidine 0.6g Eudragit E 100 6.0g	Ethanol:H <sub>2</sub> O (80:20) 100mls	1:10	very good

Organoleptic evaluation of these nizatidine powder batches indicated that an unacceptable level of bitterness was detected at a drug:polymer ratio of 1:2 but that powders containing greater amounts of the polymer were acceptable. Thus, taste-masked micromatrix powders can be formed by spray drying the drug with Eudragit E such that the amount of polymer present is at least twice the amount of drug present, more preferably at least 4 times the amount of drug present, most preferably at least 6 times the amount of drug present (wt/wt). Inclusion of a sweetener (aspartame) led to a 1 : 6 : 0.1 optimized ratio for drug:polymer:sweetener.

### Example 3

Tabletting of spray dried nizatidine powders. The taste-masked micromatrix powder can be combined with conventional pharmaceutical excipients to provide the final dosage form such as sprinkles, suspensions and effervescent, fast melt or chewable tablets. Examples of excipients

include a sweetener, a diluent, a pH control agent, a flavor enhancer, a flavorant, a lubricant, a glident, a disintegrant or mixtures thereof.

- 5 Formulation of chewable tablets was carried out using the spray-dried Nizatidine:Eudragit-E-100:Aspartame powder. Several batches (summarised below) were prepared in which the major excipients were mannitol, xylitol, dextrose and aspartame; the flavors used were orange and raspberry. The tablets were compressed on a single station Fette, using 15mm, round, concave punches.

Table 2							
Batch	G	H	I	J	K	L	M
Nizatidine Blend	1666.0	1666.0	-	-	-	-	-

Citric Acid	68.0	55.0	55.0	13.0	-	-	-
Sodium Bicarbonate	55.0	55.0	55.0	13.0	-	-	-
Dextrose	154.0	154.0	631.3	90.3	245.7	116.3	116.3
Mannitol	-	-	631.3	262.5	131.2	262.5	262.5
Xylitol	-	-	-	262.5	262.5	262.5	262.5
Aerosil 200	8.0	8.0	-	5.7	5.7	5.7	5.7
Raspberry Flavor	-	13.5	-	-	-	-	14.1
Masking Agent	-	13.5	-	-	-	-	-
Orange Flavor	20.0	-	-	14.1	14.1	14.1	-
Aspartame	3.0	5.0	-	4.7	4.7	4.7	4.7
Mg. Stearate	6.0	10.0	10.0	7.6	7.6	7.6	7.6

- 10 The nizatidine blend used in the batches G and H consisted of a 1:1:1 blend of (spray dried nizatidine:Eudragit E-100:aspartame in a ratio of 1:6:0.1) to mannitol to xylitol. This blend was combined with the remaining excipients and compressed into tablets. These formulations were acceptably taste masked.

- 15 The nizatidine granulate used in batch I is a spray granulate of spray-dried nizatidine powder (nizatidine: Eudragit E: aspartame in a ratio of

1:6:0.1) with aqueous PVP (K-25) 15.72mg/tablet. The remaining excipients were combined with the granulate and compressed into tablets. The resulting tablet was not effectively taste masked. It was discovered that traditional wet granulation of the spray dried powders, such as with aqueous PVP, or granulation of the spray dried powders in a fluidized bed system lost most of the taste masking that was originally gained by spray drying the nizatidine with an amount of Eudragit E that was more than twice the amount of nizatidine present. One possible explanation is that water present in the granulating mixture causes a leeching of nizatidine from the micromatrix of the polymer/drug powder formed during spray drying.

The nizatidine powder used in batches J-M was spray dried nizatidine:Eudragit-E-100:aspartame in a ratio of 1:6:0.1. The powder was combined with the remaining excipients and compressed into tablets. These four batches were prepared after organoleptic evaluation indicated that the taste of the orange flavored tablets was improved if both the citric acid and the sodium bicarbonate were removed. All four of these chewable formulations were taste masked, especially, K, L and M.

Upon evaluation of the above tablets, the most pleasingly taste-masked formulations are orange flavored batches K and L, although some expressed a personal preference for the raspberry flavored tablets M. These preferred chewable tablets do not contain citric acid/sodium bicarbonate and contain a relatively large amount of dextrose.

Table 3 presents the potencies obtained for batches K and L as measured by HPLC using a Supelcosil LC-18-DB column, 15cm x 4.6mm i.d.

Table 3			
Batch	mg/tab	% of Theoretical	% CV
K	38.1	101.6	1.9
L	33.7	89.9	5

For nizatidine, a preferred dissolution profile in acidic media is release of greater than 75% of the dose in 30 min (essentially instant release). The *in vitro* dissolution for batches E and F were measured using

USP II paddle method at 50 rpm,  $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$  in 900 ml of pH 1.2 buffered medium (5 g NaCl plus 17.5 ml concentrated HCl per 2.5 L of deionized water). The resulting *in vitro* dissolution profiles as well as the profile for the reference product (AXID AR) are given in Table 4.

5

Table 4			
Time (min)	% Released in Phosphate buffer pH1.2		
Batch	AXID AR	K	L
	mean (N=6)	mean (N=3)	mean (N=6)
5	91.3	24.4	34.7

45	100.2	113.7	105.8
60	101.3	100.1	105.2

#### Example 4

*Controlled release taste-masked micromatrix powders.* For some drugs, especially those whose target *in vitro* dissolution profile calls for controlled release over 30 min to 24 hours in addition to requiring taste-  
 10 masking, an alternative method for making taste-masked micromatrix powders that includes the use of a retarding polymer can be used. For instance, a preferred target *in vitro* dissolution profile for roxatidine is release of from 25 to 45% of the therapeutic agent after one hour, release of  
 15 from 45 to 65% after two hours and release of from about 55 to 75% after three hours.

Formulations having both excellent taste masking properties in addition to controlled release properties can be made by first spray drying the therapeutic agent with a polymer that is capable of retarding the release  
 20 of the drug in acidic media to form a controlled release powder. Suitable retarding polymers include cellulose acetate phthalate (CAP), cellulose acetate butyrate (CAB) and ethylcellulose. The resulting controlled release powder is then granulated with an amount of Eudragit E that is at least twice

the amount of the therapeutic agent (wt/wt) to form a granulate having a size less than about 125  $\mu\text{m}$ . The resulting taste-masked micromatrix powder comprises controlled release therapeutic agent powder in a micromatrix of Eudragit E. The size of the controlled release powder is suitably controlled to be less than about 75  $\mu\text{m}$ , preferably less than 50  $\mu\text{m}$  so as to enable the size of the resulting micromatrix granulate (the taste-masked micromatrix powder) to be less than about 125  $\mu\text{m}$ .

Alternatively, the controlled release powder can be formed according to the teaching of our U.S. Pat. No. 4,952,402, which reference is hereby incorporated by reference in its entirety. As above, the controlled release powder can be granulated with Eudragit E to form a micromatrix of Eudragit E and controlled release powder having a size less than about 125  $\mu\text{m}$ .

Similar to the spray dried powders discussed above in Examples 1 and 2, the Eudragit E/controlled release powder micromatrices of this Example can be subsequently formulated into final dosage forms such as sprinkles, suspensions, and effervescent, fast melt or chewable tablets.

For instance, 15.6 g of ethylcellulose (7cps) or 15.6 g of CAB (177-15S) can be dissolved in 2000 ml ethanol. 7.8 g of roxatidine can be added to the solution followed by spray drying to form the controlled release powder. Typical conditions for spray drying are: inlet temperature - 85°C, outlet temperature - 45-55°C, compressed air - 750 l/hr, pump - 75% and aspirator - 100%. This controlled release powder can then be granulated using an ethanolic Eudragit E 100 solution (31.2 g Eudragit E) to form a taste-masked micromatrix powder.

Table 5 shows loading and size details for several batches of roxatidine controlled release powders formed by spray drying an ethanolic solution of roxatidine and the controlled release polymer.

Table 5				
Batch	Formulation	Theoretical loading (w/w%)	Actual loading (w/w%)	D[v, 0.5] $\mu\text{m}$
N	Ethylcellulose / Roxatidine (2:1)	33.3	31.33	7.79
O	Ethylcellulose: Roxatidine (4:1)	20.0	21.47	6.36
P	Ethylcellulose Roxatidine (3:1)	25.0	23.61	10.21
Q	CAB Roxatidine (4:1)	20.0	-	91.07

5

*Example 5*

Four 75 mg chewable Nizatidine tablet formulations comprising taste-masked micromatrix powder of Nizatidine manufactured according to this invention are shown in Table 6. All of these products demonstrated excellent taste-masking properties. Additionally, these products tasted pleasant, were easy to chew (having a smooth feel rather than chalky or gritty), and possessed a pleasant odor consistent with the flavor.

Nizatidine Spray Dried Micromatrix Powder containing Nizatidine and Eudragit E 100 in a 1:6 ratio (wt/wt)

5 (a) NED-containing; (b) NED free; (c) NED-containing; (d) NED free

## CLAIMS: -

1. A taste-masked pharmaceutical powder comprising micromatrices containing a drug having poor organoleptic properties and a cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters, wherein the wt/wt ratio of the copolymer to the drug is greater than 2 to 1.
2. The taste-masked powder of Claim 1, wherein the powder is formed by spray drying a solution or dispersion containing the drug having poor organoleptic properties and the copolymer.
3. The taste-masked powder of Claim 1 or 2, wherein the micromatrices further comprise a retarding polymer.
4. The taste-masked powder of Claim 3, wherein the retarding polymer and the drug having poor organoleptic properties comprise a controlled release powder.
5. The taste-masked powder of Claim 4, wherein the taste-masked powder is formed by granulating the controlled release powder with the cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters.
6. A taste-masked pharmaceutical powder comprising micromatrices containing a controlled release powder and a cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters, wherein the controlled release powder comprises a drug having poor organoleptic properties and a retarding polymer and wherein the wt/wt ratio of the cationic copolymer to the drug is greater than 2 to 1.
7. The taste-masked powder of any preceding claim, wherein the wt/wt ratio of the copolymer to the drug is greater than 4 to 1.
8. The taste-masked powder of any one of Claims 1-6, wherein the wt/wt ratio of the copolymer to the drug is greater than 6 to 1.

9. The taste-masked powder of any preceding claim, wherein the cationic copolymer synthesized from dimethylaminoethyl methacrylate and neutral methacrylic acid esters is Eudragit E.
10. The taste-masked powder of any preceding claim, wherein the drug having poor organoleptic properties is selected from the group consisting of H<sub>2</sub> receptor antagonists, antibiotics, analgesics, cardiovascular agents, peptides or proteins, hormones, anti-migraine agents, anti-coagulant agents, anti-emetic agents, anti-hypertensive agents, narcotic antagonists, chelating agents, anti-anginal agents, chemotherapy agents, sedatives, anti-neoplastics, prostaglandins and antidiuretic agents.
11. The taste-masked powder of Claim 10, wherein the drug is nizatidine.
12. The taste-masked powder of Claim 10, wherein the drug is roxatidine.
13. A taste-masked pharmaceutical dosage form comprising a therapeutically effective amount of the taste-masked powder of any of Claims 1-12.
14. The taste-masked pharmaceutical dosage form of Claim 13, wherein the dosage form is selected from the group consisting of sprinkles, suspensions, effervescent tablets, fast melt tablets and chewable tablets.
15. A taste-masked pharmaceutical powder according to Claim 1, substantially as hereinbefore described and exemplified.
16. A taste-masked pharmaceutical powder according to Claim 6, substantially as hereinbefore described and exemplified.
17. A taste-masked pharmaceutical dosage form according to Claim 13, substantially as hereinbefore described and exemplified.
